

SYSTEM, METHOD AND COMPUTER PROGRAM PRODUCT
FOR READING, CORRELATING, PROCESSING, CATEGORIZING
AND AGGREGATING EVENTS OF ANY TYPE

ABSTRACT

A system, method and computer program product are provided for handling network accounting information. Initially, records indicative of network events are received from an input source. Next, action events are selected based on the input source. Such selected action events are then executed on the records for reading, correlating, processing, categorizing, and/or aggregating network accounting information associated with the records.
